

ACIS Contaminant and Cross-Cal Implications Now, with even more Oxygen!

Herman L. Marshall
May. 12, 2014

A Short History

- 1999: Chandra Launch
- 2000: Anomalous C-K edge — LETG only?
- 2001: Contaminant thickens
- 2002: Composition determined (COF), edge NEXAFS indicates C-C single bonding
- 2003: Spatial variation found: thin at FoV center
- 2004: Fluffium invented as LETG/ACIS and cal source disagree; new model released
- 2010: Deposition accelerates, Gaussium replaces fluffium
- 2014: Deposition rate acceleration still positive

Recent Progress

- LETG/ACIS: N_o/N_c varies in time
- 2013 Released Model
 - Foundation is Cluster based, Gaussium is eliminated
 - Adjusted nonphysically to fit LETG/ACIS data
 - Verified with I E0102, Clusters
- Developments
 - A1795 observations continue
 - LETG/ACIS of Mk 421 (3/14): “Big Dither”
 - Deposition rate increases

Clusters Drive Model

alexey 30-Apr-2012 16:18

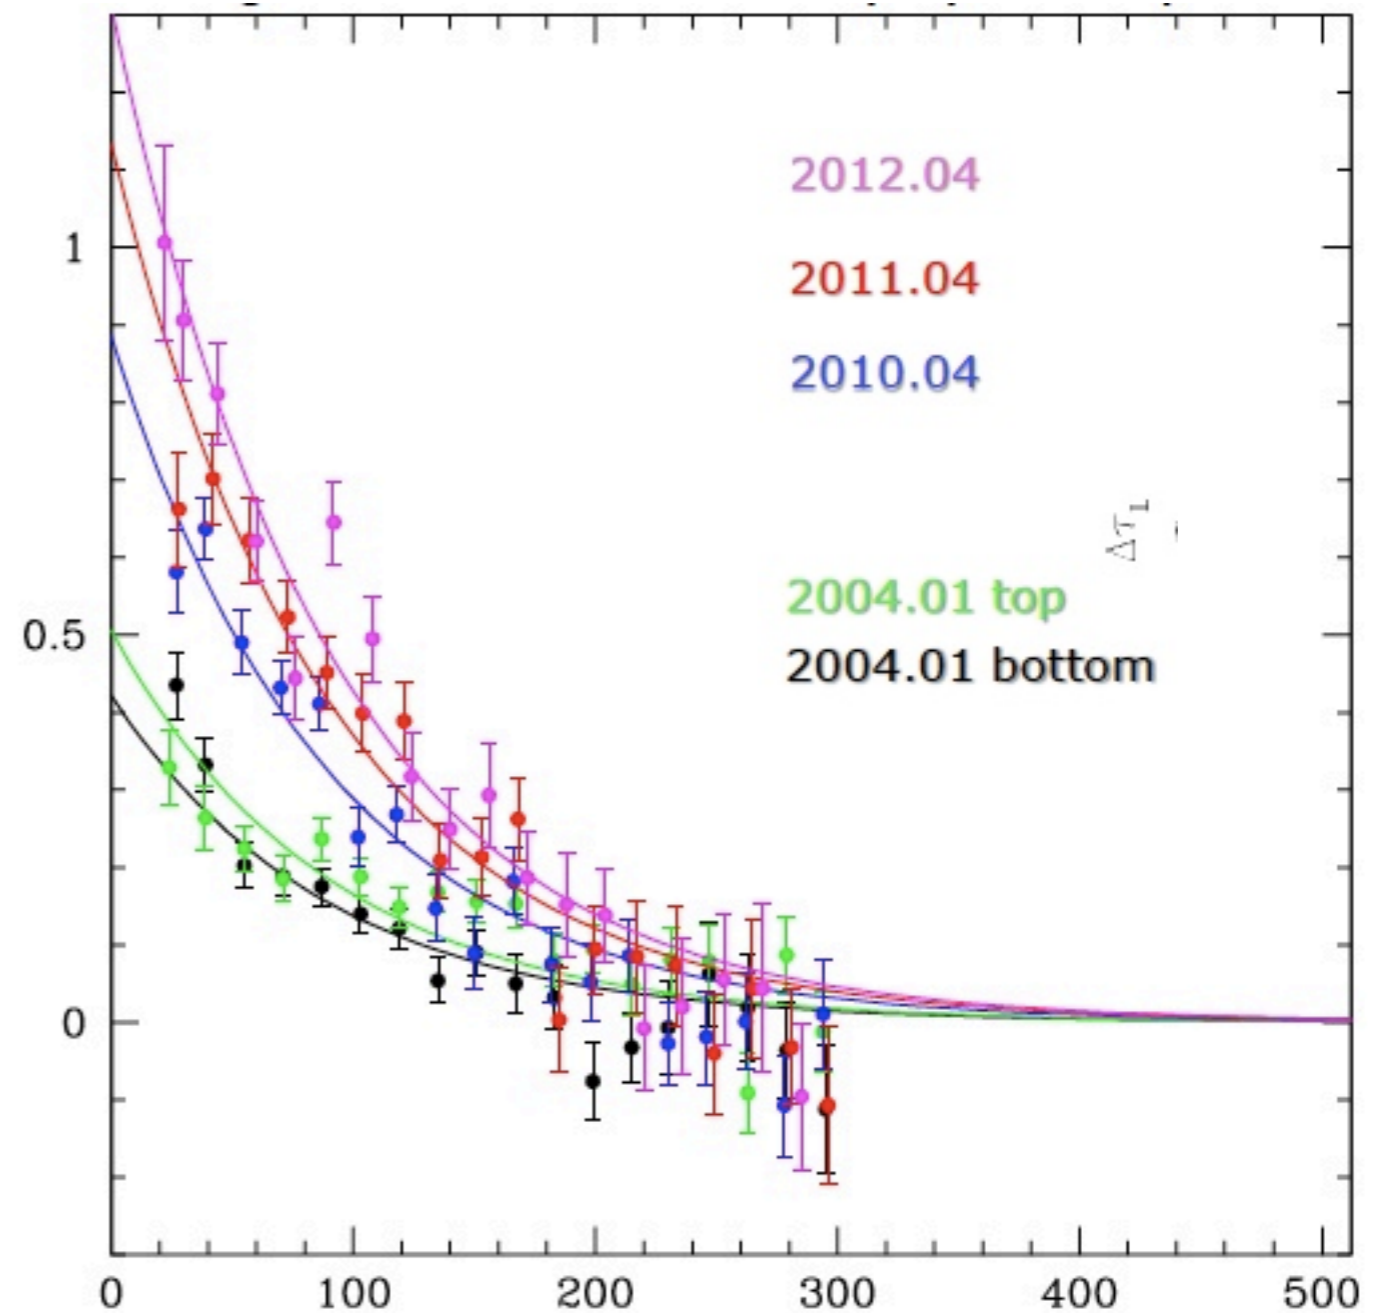

Clusters replace ECS

- External Cal Source gives $\tau(700 \text{ eV})$ using Mn-L/Mn-K
- ECS Mn-L is getting too faint
- Cluster spectral model is simple
- Problem: τ at launch?

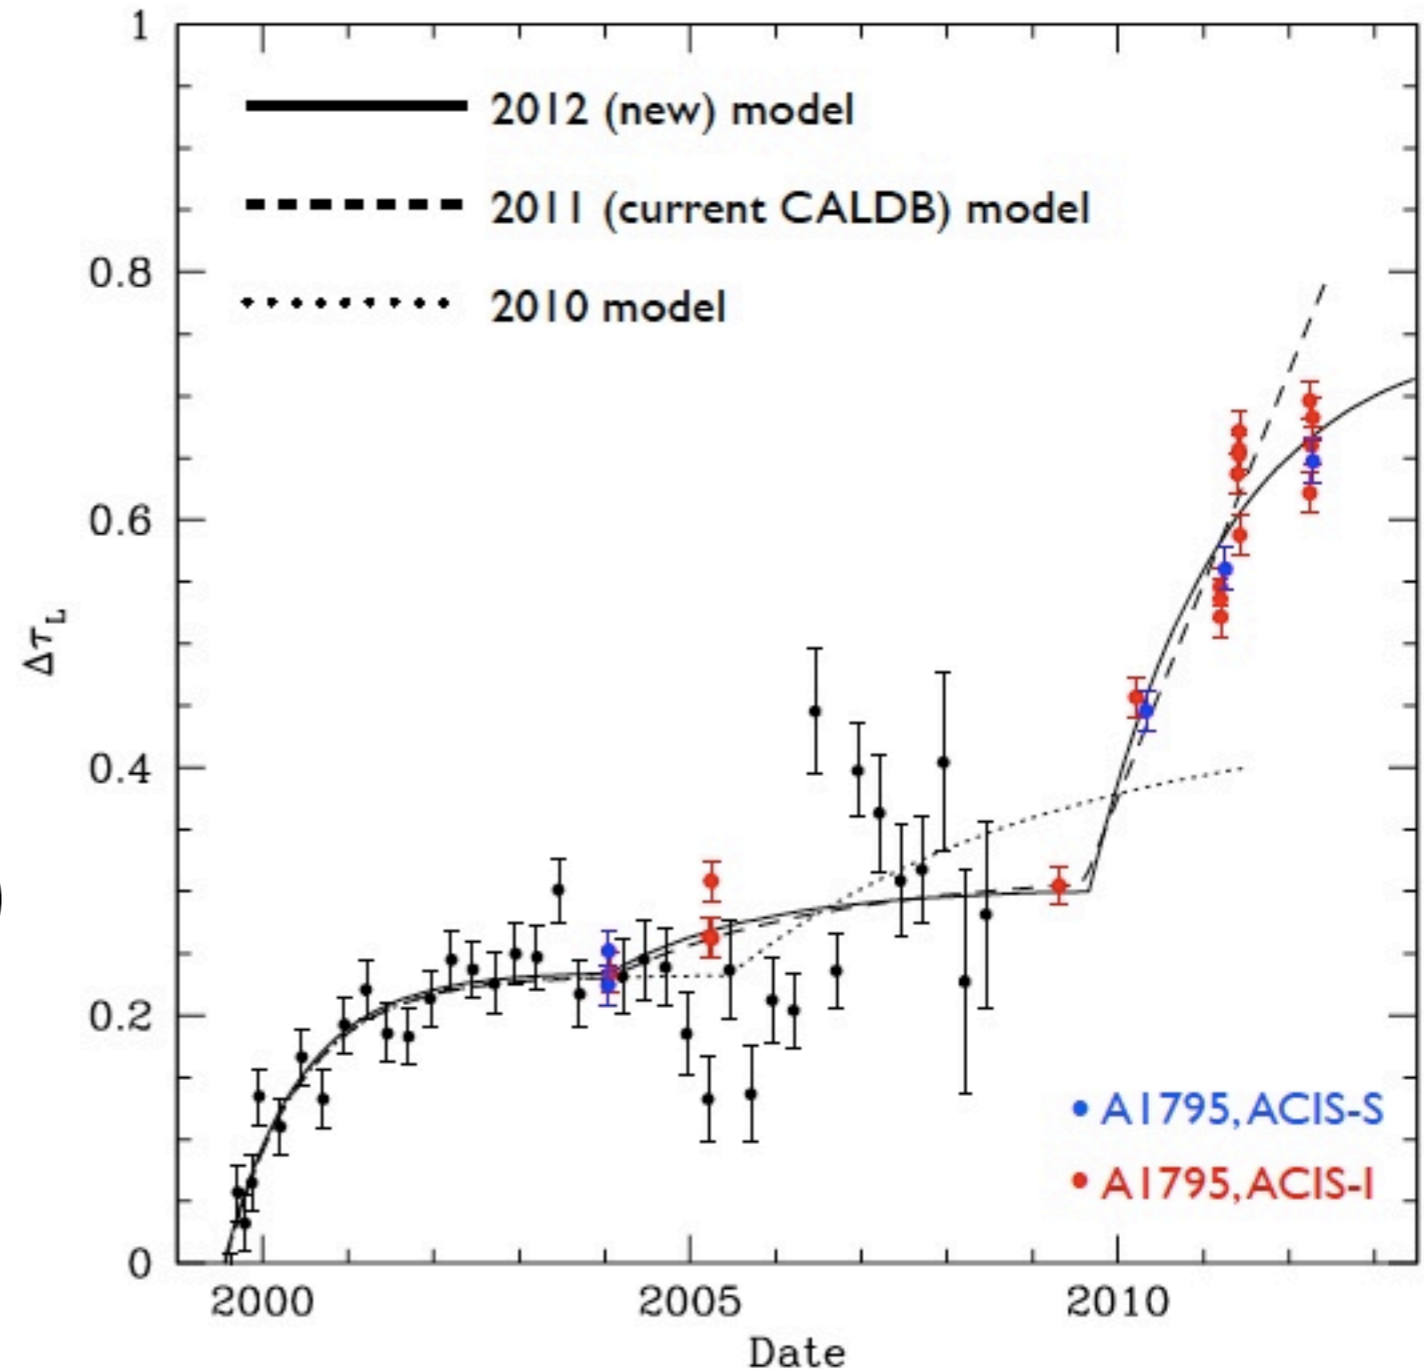

Setting Spatial Model

- Again, ECS Mn-L is now too faint
- A1795 used at different positions
- Jump apparent in 2010
- ACIS-I and ACIS-S are similar

Setting Spatial Model

- Again, ECS Mn-L is now too faint
- A1795 used at different positions
- Jump apparent in 2010
- ACIS-I and ACIS-S are similar

Spectral Model

- LETG/ACIS used
- C, F, O edges observed
- Composition doesn't match on-board materials
- LETGS doesn't match ECS

EXAFS & NEXAFS

Mk 421 LETGS TOO

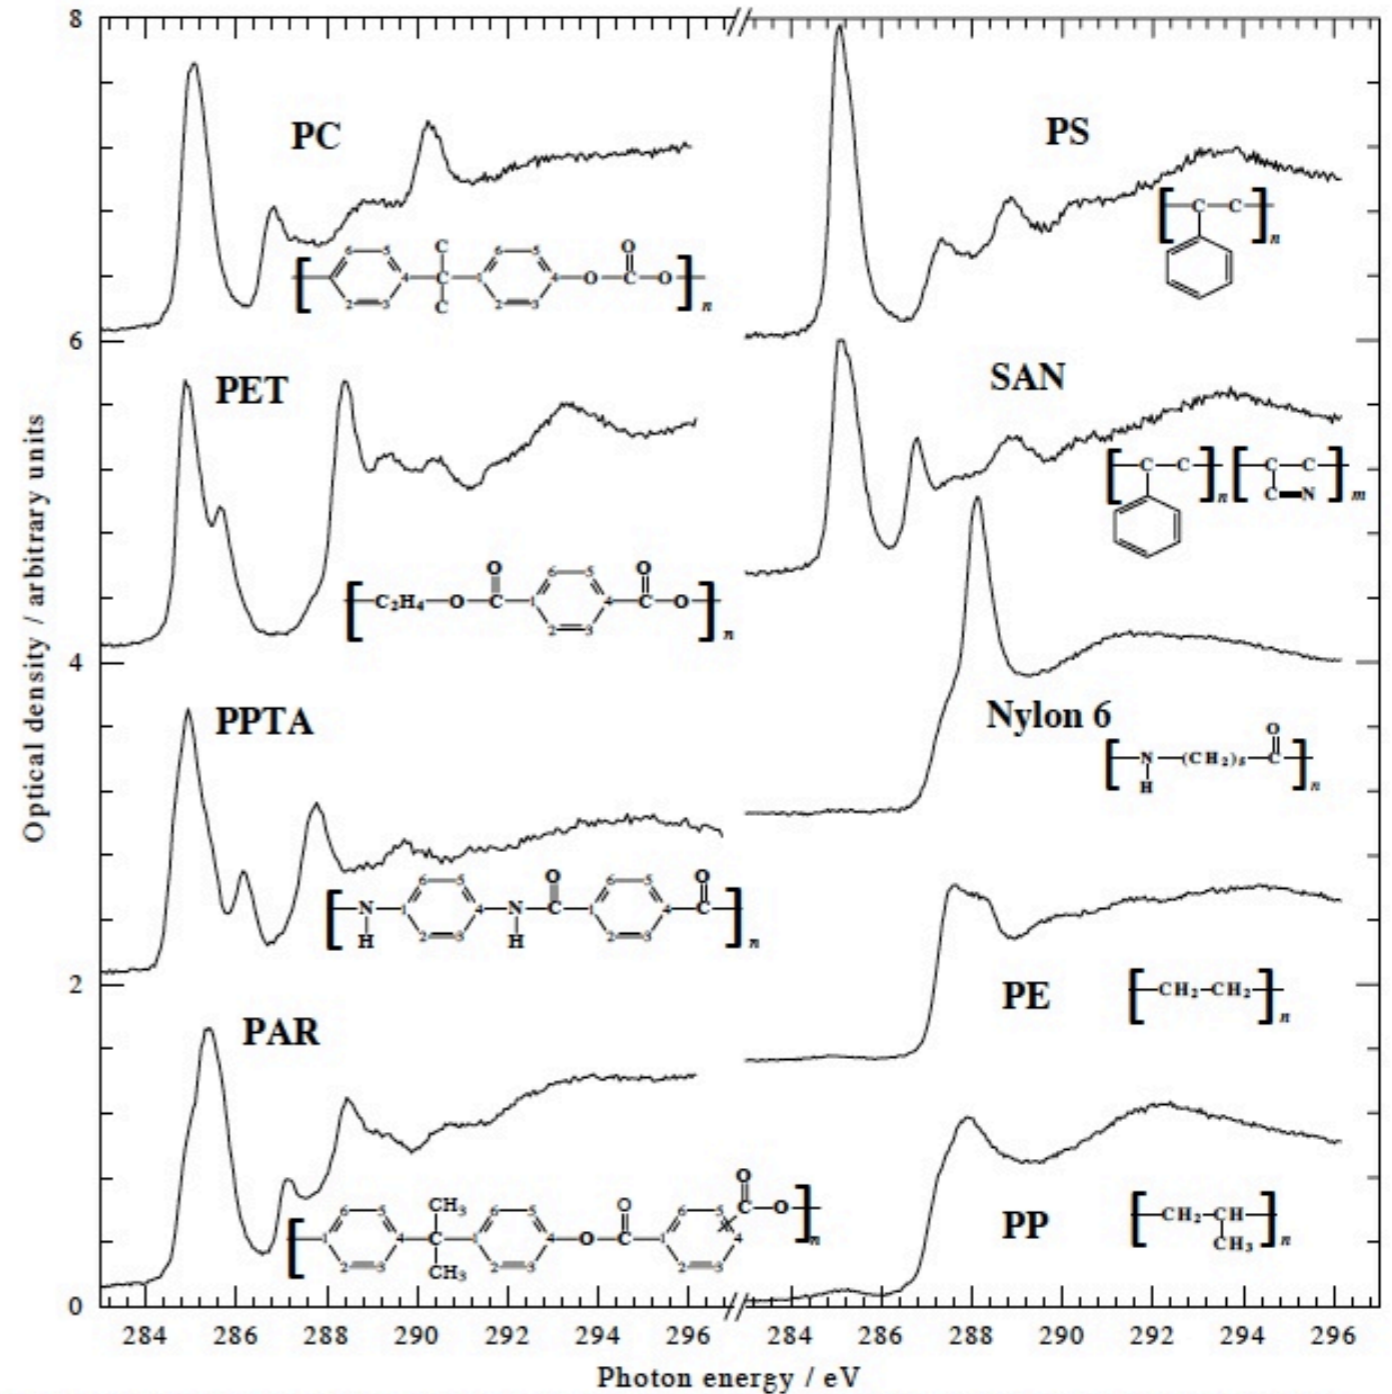

Fig. 3 C 1s NEXAFS spectra of some common polymers. Abbreviation as follows: PC, polycarbonate; PET, poly(ethylene terephthalate); PPTA, poly(p-phenylene terephthalamide); PAR, polyacrylate; PS, polystyrene; SAN, styrene-acrylonitrile; Nylon-6, poly(ϵ -caprolactam); PP, polypropylene; PE, polyethylene. (Figure adopted from [Ade 97])

Mk 421: Fit to elemental model

reduced chisq: 1.91

LETG/ACIS Fit Results

Adding O-K Variation

S3, ObsID 15559, C-stat=228.530, dof=80, Q-stat=235.2, reduced Q stat=2.94

jpbrown 7-Feb-2013 11:40

Adding O-K Variation

IACHEC E0102 model + O-K edge
S3, ObsID 15559, C-stat=148.554, dof=79, Q-stat=151.1, reduced Q stat=1.91

jpbrown 27-Feb-2013 17:02

Revised |E0|02 Fluxes

S3 subarray fits: 08 normalization

Revised I E0 I 02 Fluxes

S3 subarray fits: Ne9 normalization

LETG-ECS Problem

- Model fitting ECS and clusters doesn't fit LETGS (purple)
- Offsetting ECS doesn't fix problem entirely

Less C-K needed!

Fits using Model 9951

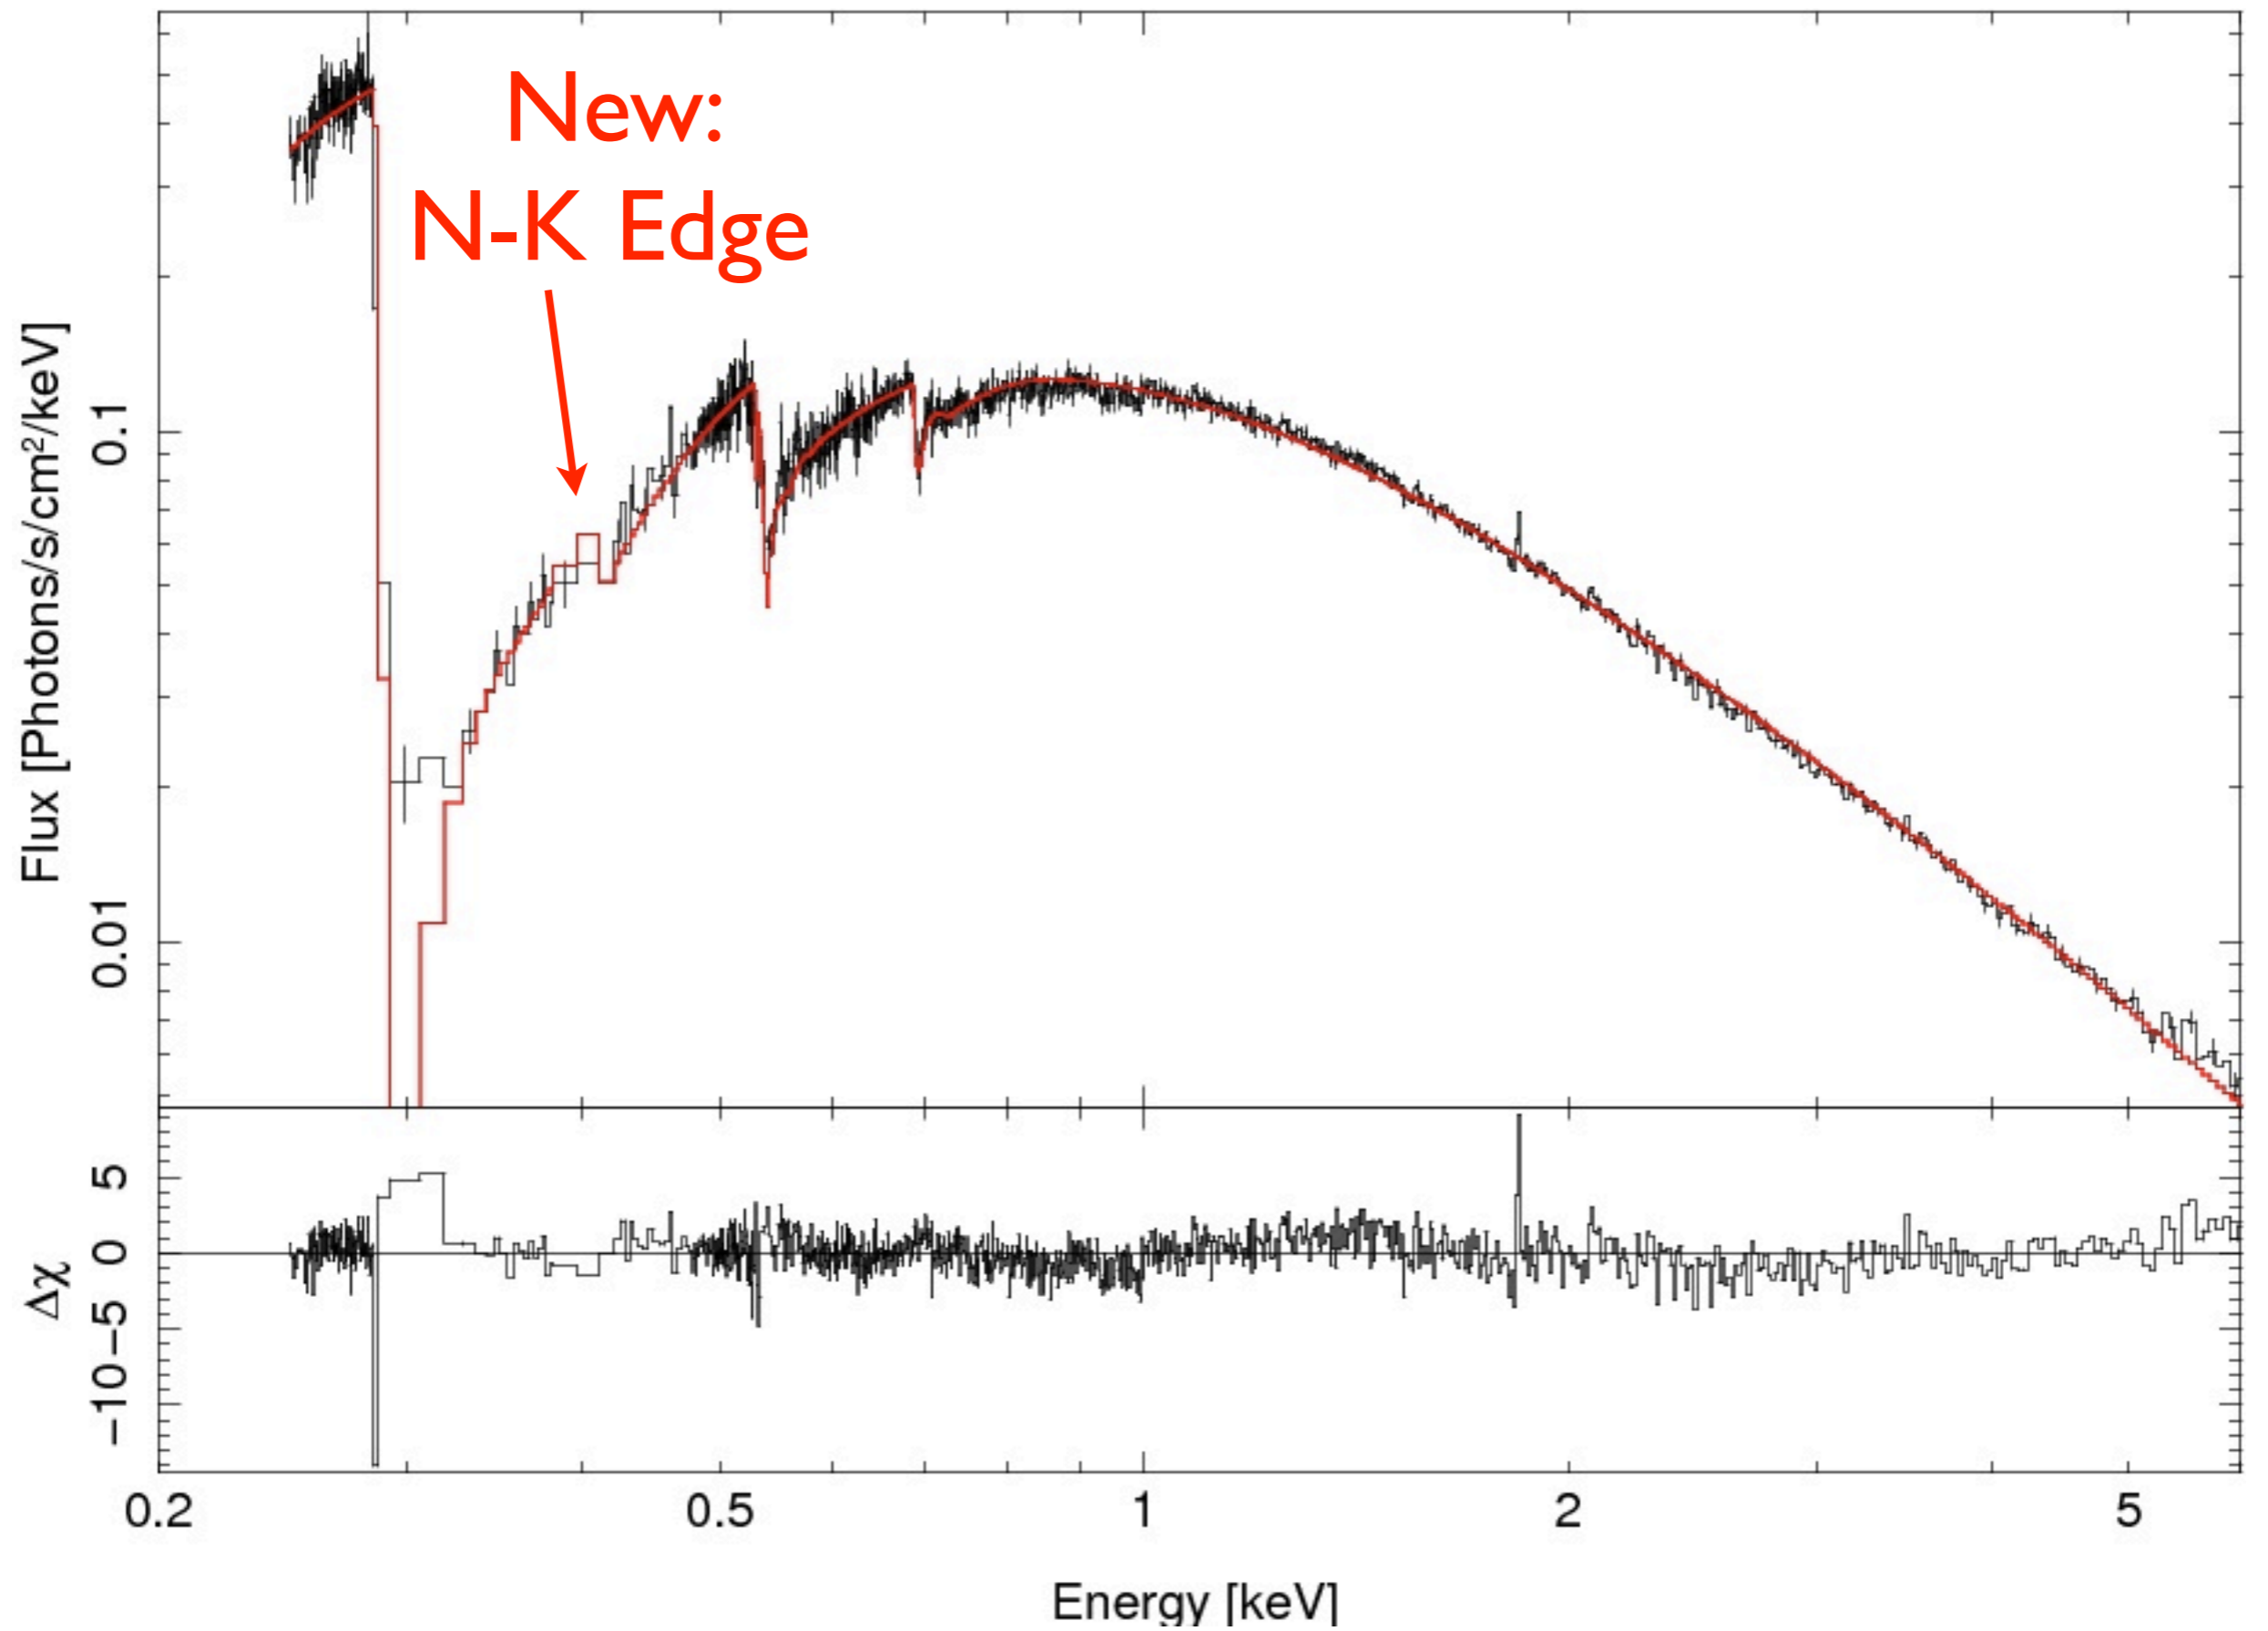

Hack in Released Model

- Adjust edges of C-K, F-K to match LETGS
- Force $\tau(700)$ to below 2%
- Component varies with time

Spectra fit now bad

Big Dither!

Edge Depths

	C-K	N-K	O-K	F-K
+I	4.81 ± 0.16	0.111 ± 0.08	0.54 ± 0.01	0.186 ± 0.007
-I	4.36 ± 0.06	0.291 ± 0.036	0.55 ± 0.02	0.121 ± 0.009

Comparison of LETG/ACIS +1 and -1 data

Contaminant Summary

- It's still growing: Why? Filter is colder? S/C hotter?
- Spatial variations are time-dependent
 - CCD/housing temperature difference?
 - N and O don't match C and F
 - S3 matches S2 mostly
- Composition is time-dependent
 - Two components implicated, one is C-rich
 - ECS-LETGS disagreement unresolved
- Origin is unknown — not in original form
 - No on-board substance has contaminant's CFO ratios
 - Radiation-induced organic fracturing?
