STUDY OF THE ANDROMEDA NEBULA FROM A SPECTROSCOPIC
SURVEY OF EMISSION REGIONS*

VERA C. RUBIN[†] AND W. KENT FORD, JR.[†]

Department of Terrestrial Magnetism, Carnegie Institution of Washington and
Lowell Observatory, and Kitt Peak National Observatory[‡]

Received 1969 July 7; revised 1969 August 21

FIG. 1.—Identification chart for emission regions in M31 for which velocities have been obtained. Palomar 48-inch Schmidt ultraviolet photograph, 103aO plate + UG 1 filter, courtesy of Dr. S. van den Bergh.

FIG. 9.—Rotational velocities for OB associations in M31, as a function of distance from the center. *Solid curve*, adopted rotation curve based on the velocities shown in Fig. 4. For $R \leq 12'$, curve is fifth-order polynomial; for $R > 12'$, curve is fourth-order polynomial required to remain approximately flat near $R = 120'$. *Dashed curve* near $R = 10'$ is a second rotation curve with higher inner minimum.

FIG. 12.—*Left:* range of calculated values of total mass for M31, as a function of distance to center for fourteen rotation curves (Fig. 11). Dotted region indicates range of fourteen multiply intersecting curves. *Right:* range of calculated values of surface density of M31, as a function of distance to center. Dotted region indicates range of multiply intersecting curves.

ON THE MEASUREMENTS OF D/H IN QSO ABSORPTION SYSTEMS

Closing in on the primordial abundance of deuterium

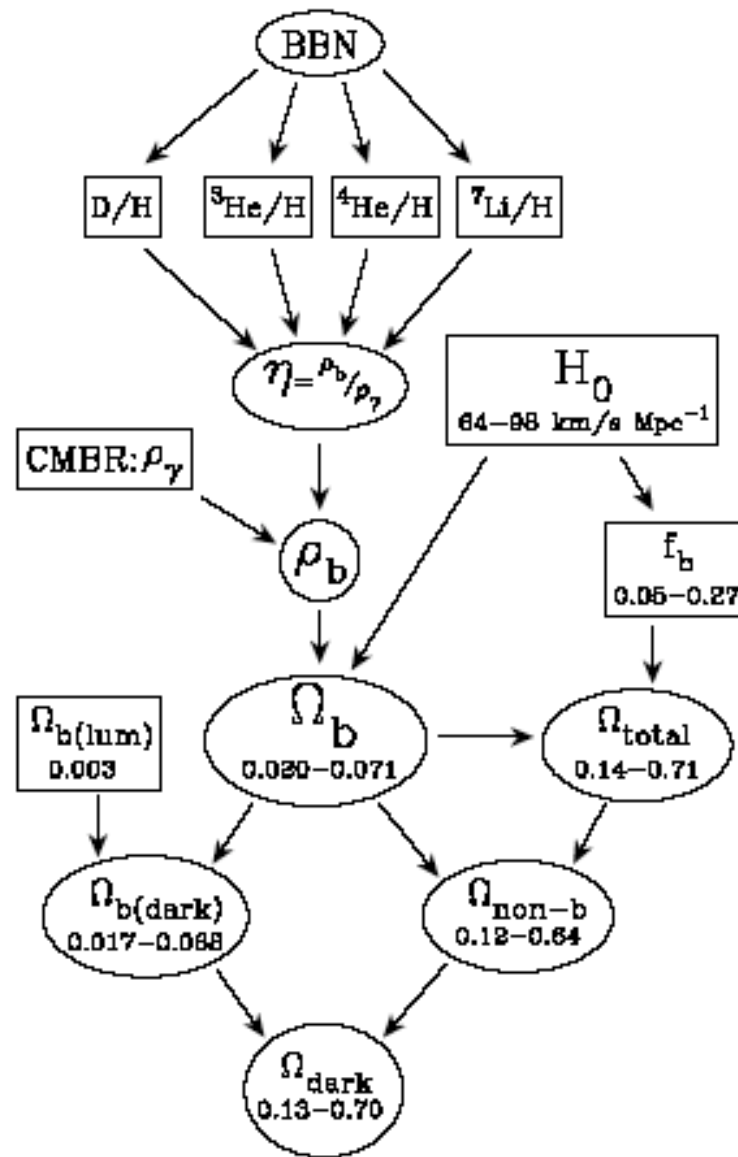

Fig. 1a—d. Theoretical D L α –H L α blended line profiles. The assumed abundance ratio, $n(\text{D})/n(\text{H})$, and the H L α line center optical depth are taken to be 10^{-5} and 10^5 for blends (a), (b) and (c), and 10^{-4} and 10^4 for blend (d), respectively. The Doppler velocity, v_0 , and implied neutral hydrogen column densities, N_{H} are: (a), 6 km s^{-1} ($0.79 \cdot 10^{18} \text{ atom cm}^{-2}$); (b), 10 km s^{-1} ($1.3 \cdot 10^{18} \text{ atom cm}^{-2}$); (c), 15 km s^{-1} ($2.0 \cdot 10^{18} \text{ atom cm}^{-2}$); (d), 15 km s^{-1} ($2.0 \cdot 10^{17} \text{ atom cm}^{-2}$). The profiles were calculated using Harris' approximation to the Voigt function as tabulated by Aller (1963)

Figure 20.1: The abundances of ${}^4\text{He}$, D, ${}^3\text{He}$ and ${}^7\text{Li}$ as predicted by the standard model of big-bang nucleosynthesis — the bands the 95% CL range. Boxes indicate the observed light element abundances (smaller boxes: $\pm 2\sigma$ statistical errors; larger boxes: $\pm 2\sigma$ statistical *and* systematic errors). The narrow vertical band indicates the CMB measure of the cosmic baryon density, while the wider band indicates the BBN concordance range (both at 95% CL). Color version at end of book.
