

**“The display is the computer.”**

Jen-Hsun Huang, 2002

**“Good design is problem solving.”** Jeffrey Veen

**“[Users] make their credibility-based decisions about the people or organization behind the site based upon the site's overall visual appeal.”**

Stanford Persuasive Technology Lab

**“Design is not just what it looks like and feels like. Design is how it works.”** Steve Jobs

**“Where there is no difficulty there is no praise.”**

Samuel Johnson

Developers are from one planet

Designers are from some other planet

**Users are from earth**

“IT professionals have a responsibility to understand the use of standards and the importance of making Web applications that work with any kind of device.”

- Sir Tim Berners-Lee  
*inventor of the world wide web*

# What is she talking about?

- ✦ Why good code matters: **code snob = good**
- ✦ Report from the trenches: **Touchstone/CAMS**
- ✦ Workflow: **MAP, shared patterns, collaboration**
- ✦ What we need from you: ...

**Tag soup and spaghetti code** ≠ nutritious

Why good front-end code matters

**“The display is the computer.”**

Jen-Hsun Huang, 2002

# Hand and Upper Extremity Service

# Ugly = Costly

Kludgy (yet valid) CSS fix, which requires listing each submit button's unique ID:

```
#wwctrl_Activate_0, #wwctrl_AddAlternateSecurity_0, #wwctrl_AdminAddAccount_0,  
#wwctrl_NameUpdate_0, #wwctrl_processForgotPassword_0,  
#wwctrl_processForgotPasswordChange_0, #wwctrl_ProfileChangePassword_0,  
#wwctrl_SelfRegister_0, #wwctrl_ResendActivation_0, #wwctrl_UpdateName_0  
{  
    line-height:0pt;  
    margin:-20px 0pt 0pt;  
    padding:0pt;  
    width:2em;  
}
```

HTML

```
<div class='blog' >  
  <div class='entry' >  
    <h1>Why CSS Matters</h1>  
    ...
```

CSS

```
div.blog {  
  float: left;  
  width: 100%;  
  font-family: verdana;  
  ...
```

# New wrinkle = **AJAX**

Now we're not just designing the user interface, but *user interactions with page behaviors*. Now we're doing **user experience design**.

```
<a href="javascript: doSomething();" >click for fun</a>
```

```
<a href="#" onclick="doSomething();" >click for fun</a>
```

```
<a href="realpage.html" onclick="doSomething(); return false;" >click for fun</a>
```

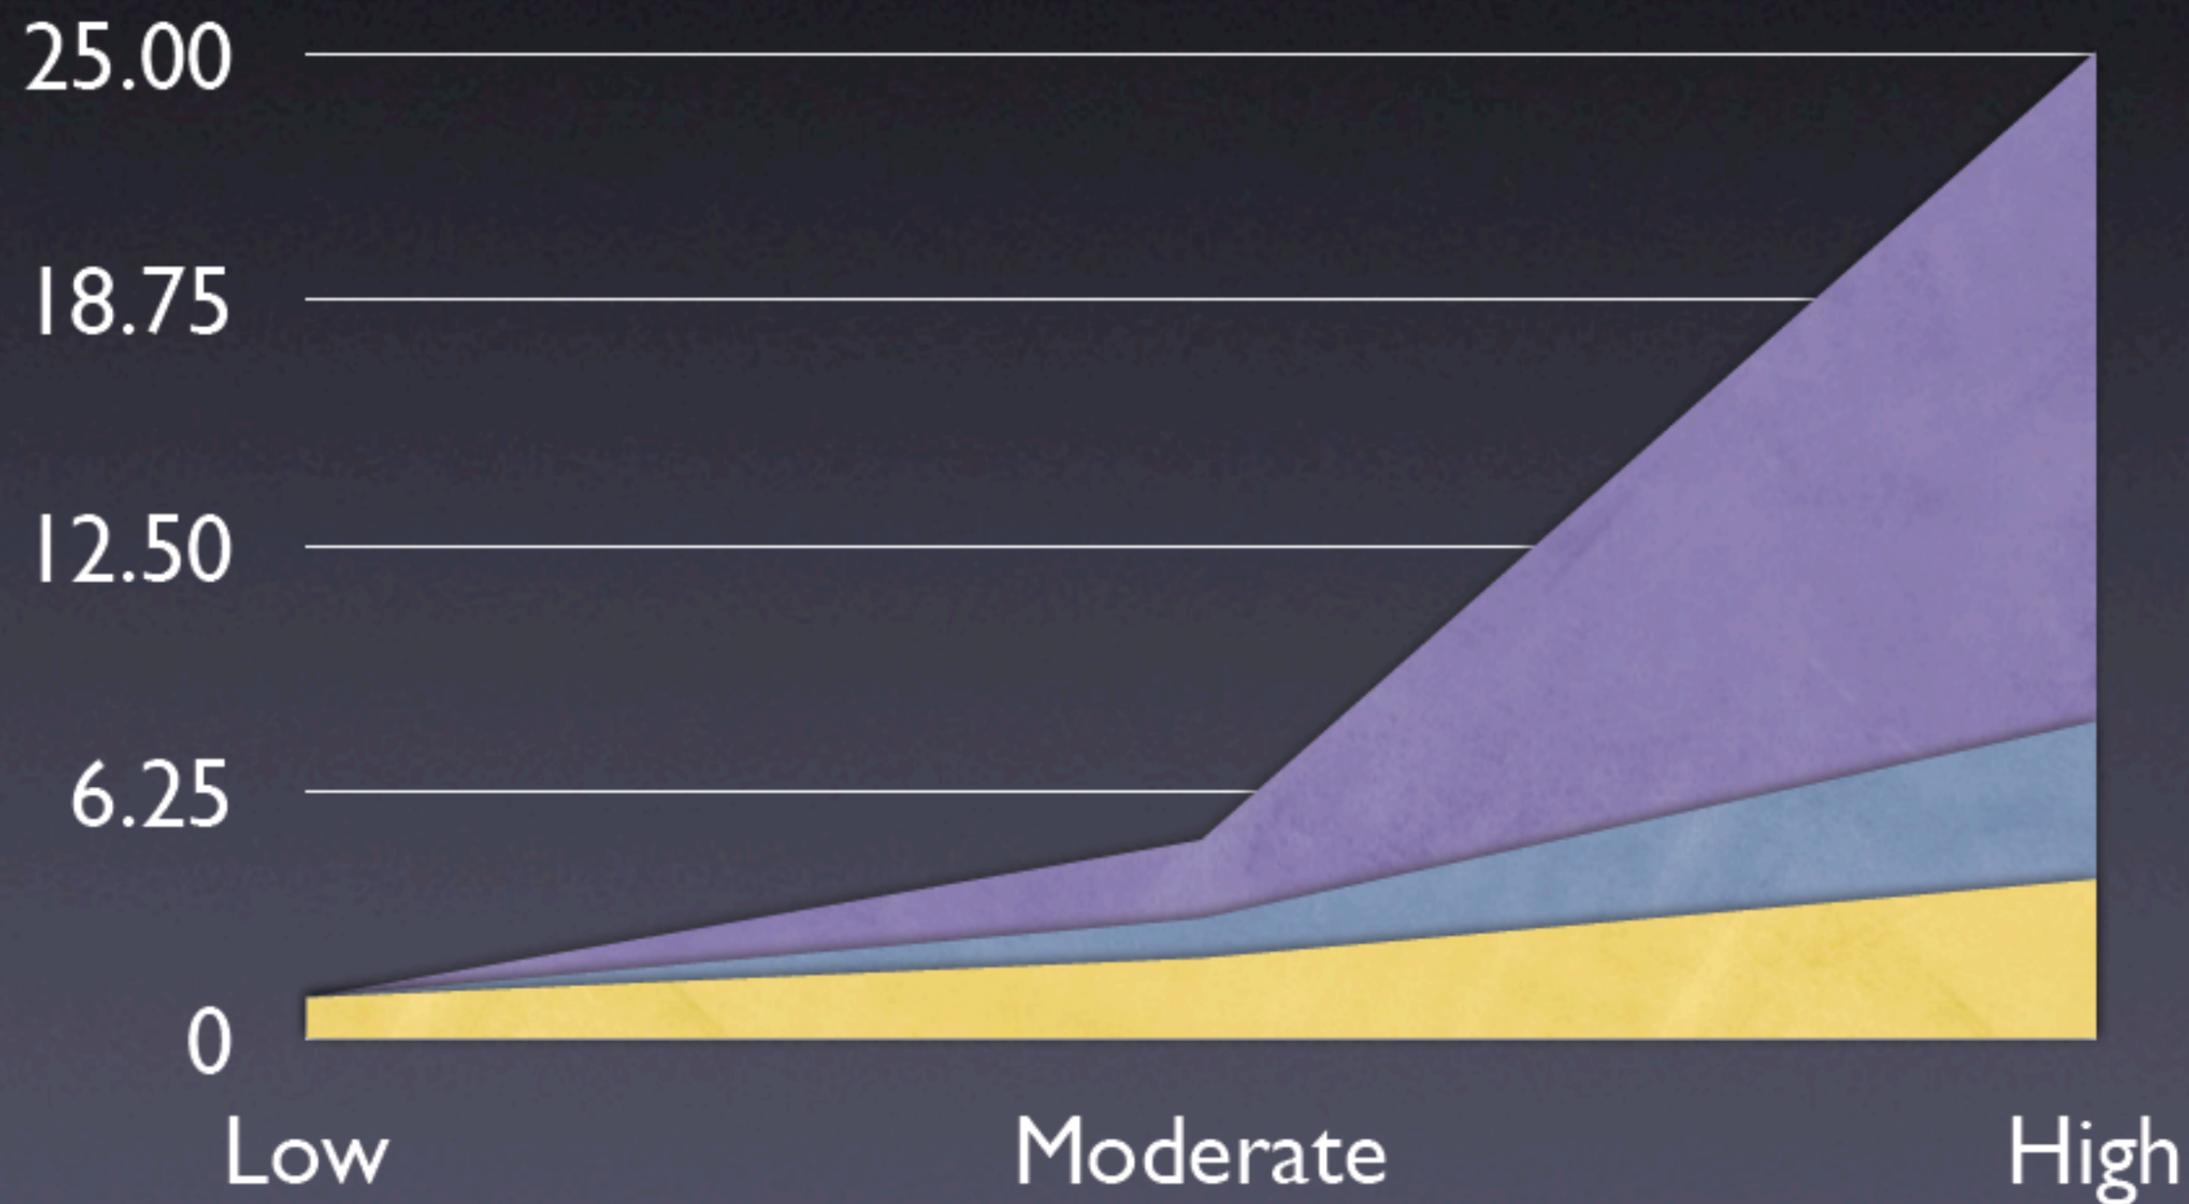

```
<div class='blog' onClick='showEntries()'>  
  <div class='entry' onMouseOver='showPreview()'>  
    <h1>Why CSS Matters</h1>
```

The return of tag soup

Really simple

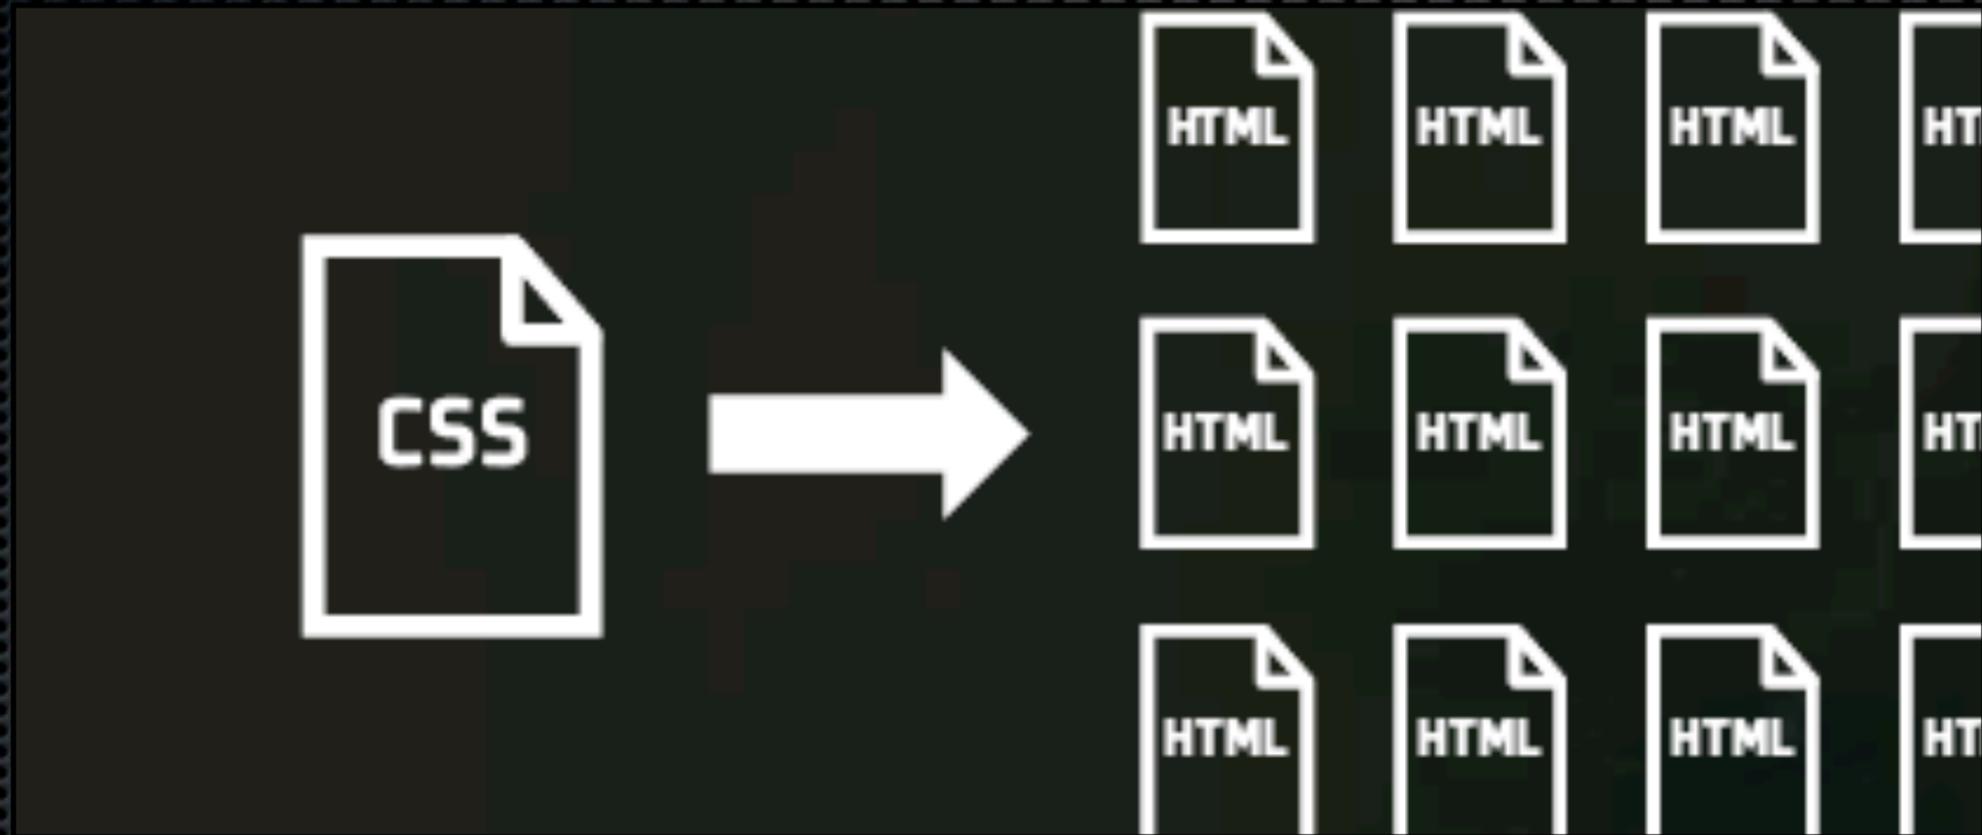

Do you like getting things delivered on time and on budget?

■ HTML + CSS + UJS   ■ HTML + CSS   ■ HTML Only

# Web standards provide:

- ✦ future-proofing
- ✦ **device independence**
- ✦ validation
- ✦ **time and cost savings**
- ✦ no learning curve on handoff
- ✦ **maintainability**
- ✦ separation of concerns
- ✦ **accessibility**
- ✦ searchability
- ✦ **lighter pages = faster loads**
- ✦ infinite style combinations
- ✦ **user customization**

Don't think like a bureaucrat

It could be **pretty and valid** and still suck.

# Division of labor = basis of civilization

- ✦ Let us do the HTML, CSS, javascript, AJAX
- ✦ Workflow diagrams
- ✦ Process
- ✦ Usability & accessibility
- ✦ Developers worry about the back end - Java, Struts, PHP
- ✦ **Bring the UX people in early in the project**
- ✦ Our role in the project could be either “high level”:  
process, oversight, usability;
- ✦ or “in the trenches”:  
up to our elbows in code

Touchstone/**CAMS**

# Report from the trenches

**“Design is not just what it looks like and feels like. Design is how it works.”** Steve Jobs

# What we did right

- ✦ Got in early enough to have clear workflow diagrams in place & useful
- ✦ Close collaboration in meetings with the developers
- ✦ Scheduled usability
- ✦ Wrote valid, semantic code & CSS
- ✦ Made it generic for MIT-wide application

# Snags we hit along the way

- ✦ File access - FTP to dev servers - took 2 weeks
- ✦ Had to rip out HTML from previously used templates - took extra time
- ✦ Insufficient separation of concerns - some inline HTML & CSS still lurking in .jar files

# Lessons learned

- ✦ We need a more formal project acquisition and planning process
- ✦ We need more interoperability between developers & designers
- ✦ Current resources don't allow us to have an "in the trenches" role in the project, we're limited to "high-level" only.
- ✦ Must have better grip on the problem or business need that the project is trying to solve.

# Process followed

- ✦ **Met with the development team to agree on:**
  - ✦ what technologies they would use (high level)
  - ✦ discuss the development environment: getting access to it, how they notify about rebuilds, etc.
  - ✦ discuss how we will collaborate, communicate, and how often (via email, meetings, stopping by cubes, etc)
  - ✦ outline who will be responsible for what

# Process in an ideal world

- Workflow diagram - blueprint for pages, user flow, and error messages. Also, Ajax functionality & behaviors.
- HTML Prototype - easier to test than wireframes
- Preliminary usability review
- HTML/CSS handoff to developers (this part is where things get tricky)
- Developers hook up back end code to front end - without jury-rigs
- Functional review of pages to see if we need to tweak any styles and to check the error messages; correct any issues, verify workflow.
- Usability testing, QA, pilot

How many different ways do you want the problem solved?  
What we're doing about it

**“Good design is problem solving.”**

Jeffrey Veen

# Why bother doing this?

- ✦ Improved internal workflows, happier developers & designers
- ✦ **Standardization + Collaboration = Efficiency**
- ✦ Data access for mashups, students, APIs, webservices that has a consistent set of specs
- ✦ **Patterns library that can be used by community at large, including mashup coders**

# Separation of concerns

- ✦ Style vs. content
- ✦ Easy to read & maintain both
- ✦ Programmers focus on structure (HTML)
- ✦ Designers focus on appearance (CSS, graphics)
- ✦ Other programmers focus on behaviors & interactions (AJAX, javascript)

# Division of labor

- ✦ **Programmer/Developer:**

- ✦ Define a “behavior” in javascript
- ✦ Attach behaviors to HTML via stylesheet/spec from designer

- ✦ **Designer:**

- ✦ Define structure in HTML
- ✦ Define appearance in CSS

- ✦ **Both:**

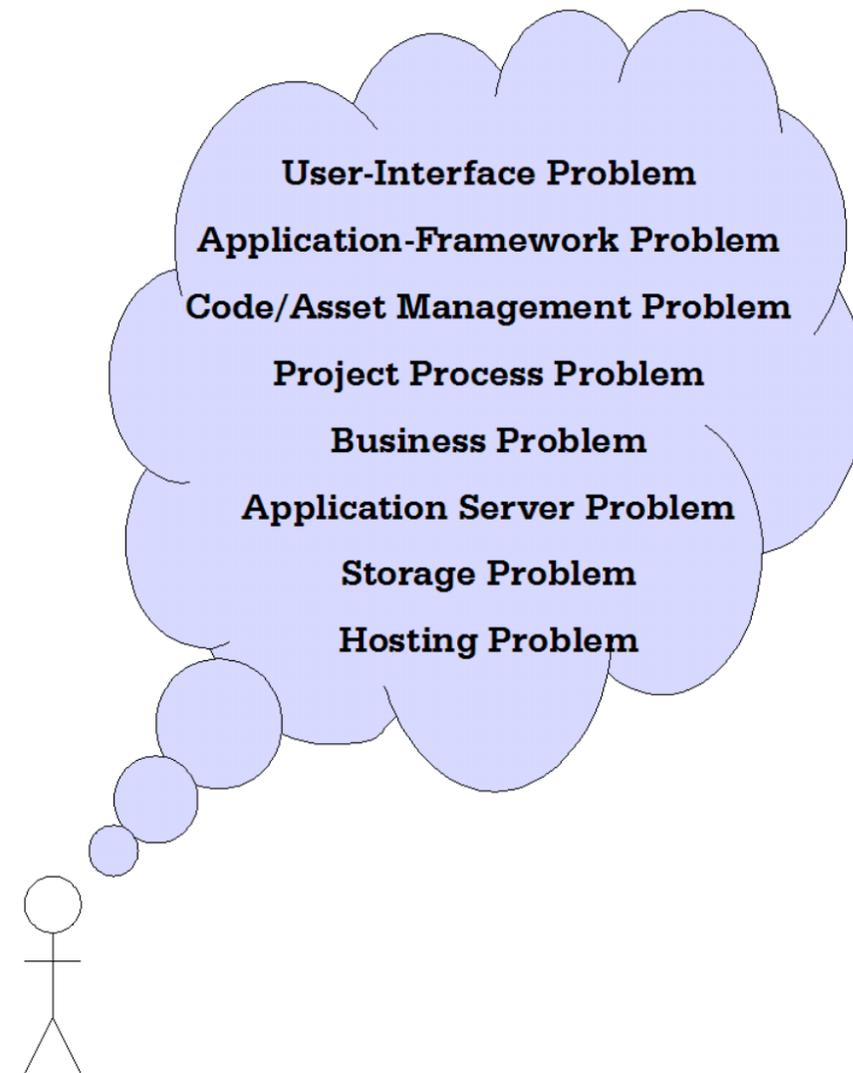

- ✦ Plan user workflow and interactions
- ✦ Plan namespace
- ✦ Prototype
- ✦ Test
- ✦ QA

# Already happening

- ✦ **jQuery standardization** - Oct. 30 meeting, another one coming up
- ✦ **MAP standardization** - SAIS already did it, we should be next
- ✦ Bi-weekly **UI meetings between Stellar/CCS and SAIS** designers/developers
- ✦ Developers need to be included in this as much as possible
- ✦ **Shared patterns library**, which we are building up and expanding for wider adoption by developers & community
- ✦ Close collaboration with usability (DCAD) and ATIC lab (accessibility)

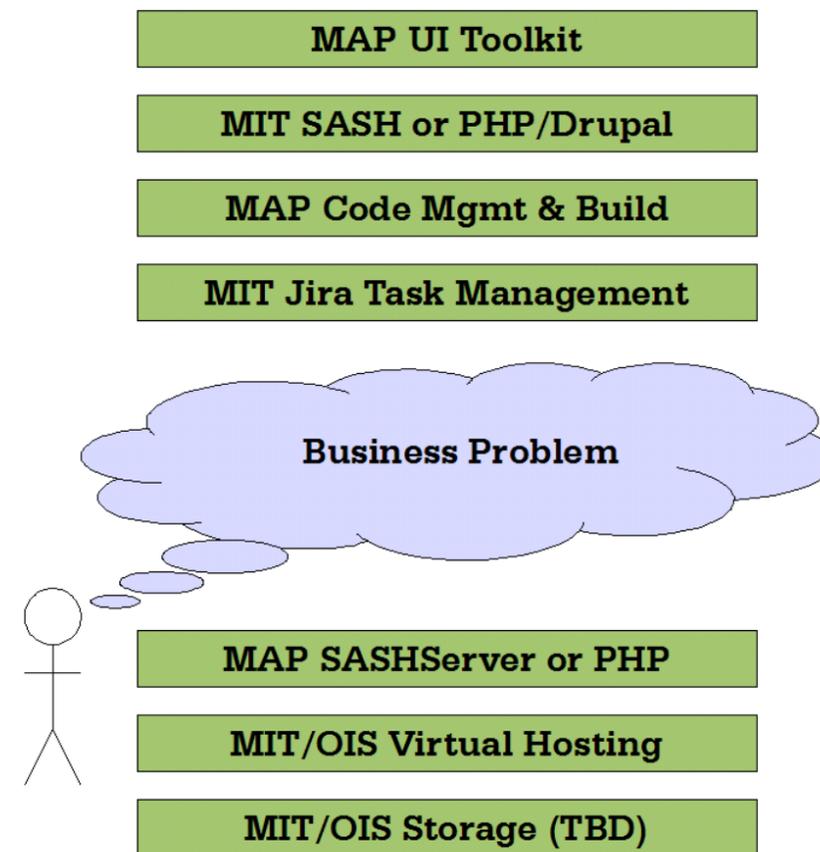

# What Is MAP?

- A standardized approach to enterprise-web development
- A centrally supported set of web-application tools to help project teams reduce their work down to solving the local problem set

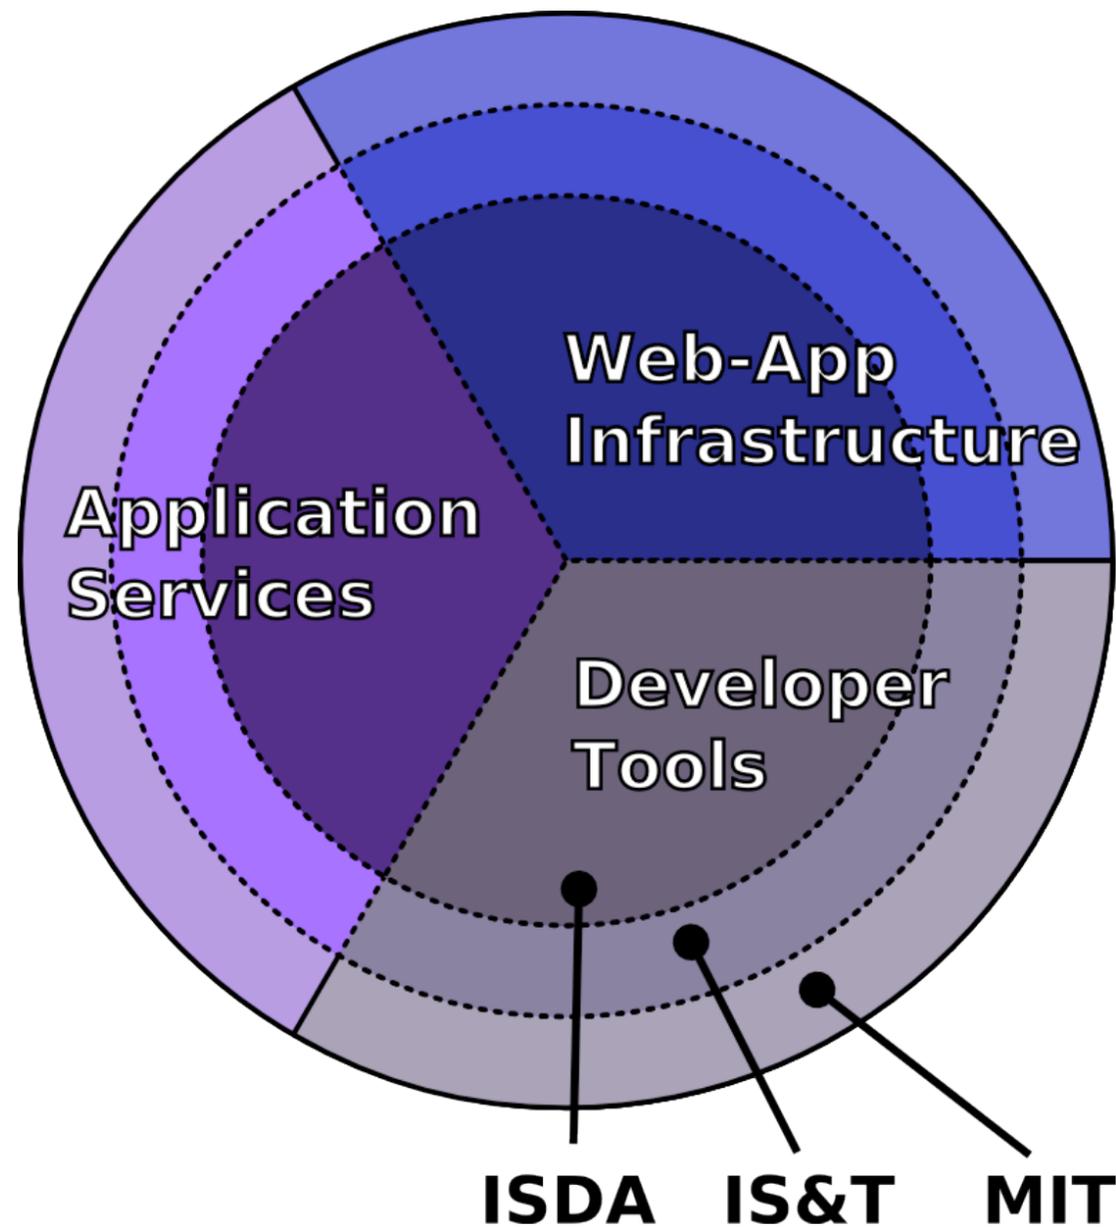

# What Is MAP?

- Servers, code management, task management, and an integrated development environment
- Teams do not have to invent a new process or core architecture for every new product.

# ISDA as the Foundation

- Standardize ISDA on MAP standards to refine the platform.
- Web-development projects become more efficient and skills can be transferred across teams.
- Roll successful components of MAP out to other IS&T teams and the MIT Community.

# Developer Tools

## Outstanding Issues

- Developers do not like to adopt standards that eliminate problem-solving tasks they enjoy.
  - ◆ Middleware framework (MIT SASH) adoption low.
  - ◆ MyEclipse IDE standardization low in ISDA, high in SAIS.
- Developers have embraced standard application servers and UI toolkits—areas they are not as invested in. MAP requires some realignment to go in this direction.
- Authentication to source-control and other code-management systems problematic: central SVN too feature-reduced.

# Conclusion

- IS&T should do more to reduce a developer's problem down to the local, business problem set.

# Action items - what we need you to do

- ✦ Set and enforce standardization as policy
- ✦ Maintain mandate & commitment
- ✦ Assign resources
- ✦ Support culture & attitude shift
- ✦ **Before you standardize on an enterprise-wide app - let us review it please**

**“Where there is no difficulty there is no praise.”**

Samuel Johnson

# Props!

- ✦ Steve Landry
- ✦ Mike Berger
- ✦ Seth Seligman
- ✦ Laura Watts
- ✦ Mike Moretti
